

TIME-BASED NETWORK CONNECTIONS

ABSTRACT OF THE DISCLOSURE

Making time-based network connections includes causing a first device to establish a connection with a second device, enabling a data transaction between the first device and the second device, determining if a time-related event has occurred since establishing the connection between the first device and the second device, terminating the connection between the first device and the second device at a time based on the occurrence of the time-related event, and reestablishing a connection between the first device and the second device, enabling another data transaction.
